

Fast Facts on the  
U.S. Government's work in

# HAITI

## ENERGY

### *The Challenge*

Prior to the January 2010 earthquake, the power sector in Haiti was among the most problematic in the Western world. Only an estimated 25 percent of the population had access to electricity services—leaving an estimated 7 million people without power. The average person in Port-au-Prince only had access to electricity 10 hours per day. Half the population was illegally connected to the power grid. Access to electricity in rural areas remains at approximately 5 percent. The fragile power sector has faced further complications due to the earthquake. Combined technical and commercial losses of electricity are approximately 75 percent, according to the World Bank. To maintain its commercial operations, Electrite d'Haiti (EDH)—the electrical utility—requires an annual Government of Haiti (GOH) subsidy of more than \$120 million, representing approximately 12 percent of the national budget.

### *USG Strategy*

Through the U.S. Agency for International Development (USAID), the U.S. Government aims to improve access and reliability of electricity in Haiti. USAID is working in support of the GOH to modernize the electricity sector and expand the generation, transmission, and distribution of electricity in targeted economic corridors and associated un-served communities.

### *Accomplishments*

- **Transition Management Contract:** A key component of the reform of the energy sector is to build an efficient and financially sound sector. USAID has awarded a contract to a private third-party utility operator to manage EDH operations and improve systems during a two-year transition period, at which point management of EDH will be transferred back to EDH or a successor entity, as decided by the Haitian government's Council for Modernization of Public Enterprises (CMEP).
- **Caracol Industrial Park Power Plant:** USAID is constructing a 10 MW power facility to provide electricity to the new Caracol Industrial Park (being constructed by the Inter-American Development Bank) and surrounding housing settlements; the power plant is scheduled for completion by June 2012. The Park will employ up to 65,000 Haitians once completed, and the power facility is a key component of the Park. The facility will be expanded to at least 25 MW to meet projected industrial and residential demands.
- **Electrical Substation Rehabilitation:** Based on assessments conducted after the earthquake, the repair and upgrade of five substations in Port-au-Prince were identified as critical priorities for the electrical sector. The underperformance of these substations is drastically reducing the system's capacity for transmission and distribution of electrical power. USAID is supporting their rehabilitation in order to reduce losses and strengthen EDH system capability to serve its customers effectively.
- **Alternative Energies:** The U.S. Department of Energy National Renewable Energy Laboratory (NREL) is undertaking wind, solar, and solid-waste-to-energy studies to determine the feasibility of renewable energy options in Haiti. USAID is studying the feasibility of solar panels on the Northern Industrial Park industrial buildings to supplement generation with clean energy. USAID also is evaluating proposals to implement improved cooking technologies.
