

FACT SHEET

MEASURE Demographic and Health Survey

MEASURE DHS seeks to increase understanding of a wide range of health issues by improving the quality and availability of data on health status and services.

Overview

MEASURE DHS is USAID's Bureau of Global Health's primary source of nationally representative and cross-nationally comparable demographic and health survey data. It addresses host countries' emerging needs for data to guide policies and programs. The range of surveys available under this project include 1) the standard national DHS, which is conducted at intervals of four-to-five years; 2) AIDS Indicators Survey, which provides indicators used for monitoring and evaluating HIV/AIDS programs; 3) Malaria Indicator Survey, which collects data used for monitoring the performance of malaria programs; and 4) Service Provision Assessment (SPA), a facility-based survey that collects data on the cost, availability, functioning, and quality of various health services.

The fifth DHS survey in Haiti is currently being implemented, and the final report is due in December 2012. The SPA is in the planning phase and implementation is scheduled to begin in September 2012.

Objectives

The project seeks to increase understanding of a wide range of health issues by improving the quality and availability of data on health status and services and enhancing the ability of local organizations to collect, analyze, and disseminate such information.

Activities

The standard national DHS and SPA surveys in Haiti includes HIV and anemia testing, as well as questions regarding alcohol use, abortion, HIV behavior and knowledge, Vitamin A, domestic violence, maternal and child health, birth registration, tuberculosis, services availability and client satisfaction.

Life of Project: On a project basis
